

# MY LEARNING PROJECT

## Goal:

With a view to make a “VIE” or to work in a international context as a IT consultant, my goal is to complete my skills system modeling by self-training.

## Expected results:

- By reading English courses : improve my ability to take timely information in a writing text ( TOEIC results)
- By readings I.T news : acquire vocabulary in I.T working environment

## Project development:

The IT professions are evolving quickly enough; technologies appear and disappear as quickly as they appear. And in the same way some acquired skills evolve. To stay on the market it is necessary to follow the movement of technology, thus continually change. I think succeed in this environment is inextricably link to learning abilities throughout a career. Therefore, I hope through this project to experiment self-directed learning in a professional context. To do that, I will learn a modeling language which I would need at the beginning of my career. Objective will be the experimentation of my ability to learn in professional environment and find out mechanisms to set up with the aim of combine pleasure and motivation in learning.

## What's the problem ?

- 1) ISFJ : I'm optimistic about my distant future but pessimistic about my near future, therefore about anything I undertake.
- 2) The optimism about my distant future (what I planned) is my spring of motivation

Problematic : “ So how to manage to be motivated and take pleasure in learning process when you are a pessimistic person and you know that what

you are learning doesn't last for a long time? “

## Operating side:

- Create and manage an I.T rss feeds
- Read tutorial in UML modeling
- Read tutorial in MS Project
- Podcast, professional social networks
- Read articles about optimism, motivation
- Read articles, books about pleasure in continuous learning

## GANTT:
